

### **WHAT THE LEADING EDGE TUBE & ALUMINUM LID WILL LOOK LIKE**

The **standard aluminum lid** assembly that covers the mechanism enclosure will attach via screws to the decking surface itself. This four piece assembly overlaps the mechanism enclosure opening at least 1½” at the back (where it screws down), and covers the remaining 3 sides of the pit. The motor end, opposite end, and main piece of lid can flip up fairly easily to allow some access to the mechanism. The leading edge tube typically stops opening off the pool somewhere just **in front** of the standard aluminum lid.

### **WHAT THE LEADING EDGE TUBE & “WALK ON” LID WILL LOOK LIKE**

The leading edge tube typically stops opening off the pool less than an inch **in front** of the lid stones; this works well, and gives a neat appearance. **To make the leading edge tube retract under the lid stones will require additional planning, see the ‘Hidden leading edge tube’ page and/or contact us for more info.**
